Project 1: Questions 4 and 5

Reducing the Graph

The dataset consisted of a very large graph (1,965,206 vertices, 2,766,607 edges) representing road networks in California. Since the purpose of this project is to demonstrate proficiency in graph analytics, we reduced the graph to a tractable size.

Reducing the graph was necessary, as the graph exceeded the computing power that we had access to. More importantly, many of the igraph functions are single-threaded.

For example, we began by running IGraph::Betweenness() on the original graph. After \sim 12 hours, we ran the <u>top</u> Unix utility to examine computer resources. Overall CPU was at a normal level, however, a single CPU core was at 100%. Given the size of the road graph, we concluded that we needed to substantially reduce the graph in order to analyze it. The non-parallel nature of the graph libraries made processing the original graph impractical- even with more computer horsepower.

Minimum degree	# of vertices
1	1,965,206
2	1,965,206
3	1,644,179
4	1,644,179
5	1,439,425
6	1,439,425
7	468,149
8	468,149
9	13,941
10	13,941

11	2,094
12	2,094
13	177
14	177
15	34
16	34
17	4
18	4
19	3
20	3

The above table was calculated with the following logic:

```
verticeCounts <- matrix(nrow=20,ncol=2)
originalGraphSize <- vcount(roadGraph)
roadGraphDegree <- degree(roadGraph)
for(minimumDegree in 1:20){
   verticeCounts[minimumDegree,1] <- minimumDegree
   verticeCounts[minimumDegree,2] <- length(which(roadGraphDegree >= minimumDegree))
}
print(verticeCounts)
```

Here, we can see that there are zero nodes of degree 1 in the graph. The graph still remains quite large, all the way down to degree size >= 8 (468,149 nodes). Since this leaves a very large graph, we removed all nodes of degree <= 8.

```
roadGraph <- delete_vertices(roadGraph, which(roadGraphDegree <= 8))</pre>
```

This left a graph containing 13,941, and finally enabled us proceed with analyzing the graph as requested in the assignment.

Question 4

Note that all functions here employ the variable "myNetwork" as defined by:

```
edges<-read.table("roadNet-CA.txt", sep="")
 #convert Graph table into matrix
 edgeMatrix<-as.matrix(edges)
 #View(edgeMatrix)
 #extracting vectors
 v1 <- edgeMatrix[,1]
v2 <- edgeMatrix[,2]</pre>
print("Building Relations")
 relations<- data.frame(from=v1,to=v2)
 #Construct graph
 print("Constructing graph from relations")
 roadGraph <- graph.data.frame(relations,directed=TRUE)
 #plot(roadGraph)
my_network = upgrade_graph(roadGraph)
myNetwork = simplify(my_network, remove.multiple = TRUE, remove.loops = TRUE, edge.attr.comb = igraph_opt("edge.attr.comb"
Function #1: is.simple
> is.simple(myNetwork)
[1] TRUE
Function #2 as adjacency matrix
> as_adjacency_matrix(myNetwork)
1965206 x 1965206 sparse Matrix of class "dgCMatrix"
  [[ suppressing 52 column names '0', '1', '2' ... ]]
[[ suppressing 52 column names '0', '1', '2' ... ]]
469 1 . . . . . . . . . . . . . . . . . .
......suppressing columns and rows in show(); maybe adjust 'options(max.print= *, width = *)'
Function #3: as.network
 > small_Network=as.network(adjmatrix_small)
 <sparse>[ <logic> ] : .M.sub.i.logical() maybe inefficient
```

Function #4: vertex attr

```
> vertex_attr(myNetwork)
  Sname
                                                                                     "469"
                                                                                                            "6"
                                                                                                                                  "385"
                                                                                                                                                          "3"
                                                                                                                                                                                                       "419"
                                                                                                                                                                                                                             "422"
                                                                                                                                                                                                                                                    "5"
        [1] "0"
      [12] "98"
                                                               "7"
                                                                                                            "9"
                                                                                                                                  "79"
                                                                                                                                                          "33"
                                                                                                                                                                                "10"
                                         "420"
                                                                                     "8"
                                                                                                                                                                                                       "84"
                                                                                                                                                                                                                             "11"
                                                                                                                                                                                                                                                    "110"
                                                              "108"
                                                                                                                                                                                "16"
                                                                                                                                                                                                      "77"
                                                                                                                                                                                                                             "17"
      [23] "12"
                                        "13"
                                                                                    "95"
                                                                                                           "14"
                                                                                                                                  "94"
                                                                                                                                                         "15"
                                                                                                                                                                                                                                                    "18"
                                                                                                          "21"
                                                                                                                                  "22"
                                                                                                                                                                                                      "26"
                                                                                                                                                                                                                             "27"
      [34] "3254"
                                        "19"
                                                                                    "23"
                                                                                                                                                         "24"
                                                                                                                                                                                "25"
                                                                                                                                                                                                                                                    "28"
                                                             "20"
      [45] "29"
                                        "30"
                                                               "3255"
                                                                                     "31"
                                                                                                            "3247"
                                                                                                                                   "3253"
                                                                                                                                                          "32"
                                                                                                                                                                                "3246"
                                                                                                                                                                                                       "2203"
                                                                                                                                                                                                                              "34"

Function #9: gden

Function #10: is connected

```
> is.connected(small_Network)
Node 1, Reach 6, Total 6
Node 2, Reach 6, Total 12
Node 3, Reach 6, Total 18
Node 4, Reach 6, Total 24
Node 5, Reach 6, Total 30
Node 6, Reach 6, Total 36
[1] TRUE
```

Question 5("Explore other functions in the igraph package – at least 15 of them not shown in the lecture notes.")

Note that all functions here employ the variable "roadGraph," as defined by:

```
#Read in table
 print("Reading table")
 edges <- read.table('roadNet-CA.txt')
 #Convert to matrix
 edgeMatrix <- as.matrix(edges)</pre>
 #Extract vectors from matrix
v1 <- edgeMatrix[,1]
v2 <- edgeMatrix[,2]</pre>
 print("Building relations from table")
 #Build relations
 relations <- data.frame(from=v1,to=v2)
 #Construct graph
 print("Constructing graph from relations")
 roadGraph <- graph.data.frame(relations,directed=TRUE)</pre>
Function #1: any multiple
 > any_multiple(roadGraph)
 [1] FALSE
Function #2: are adjacent
 > roadGraphNode1 <- V(roadGraph)[0]
 > roadGraphNode2 <- V(roadGraph)[1]</p>
 > are_adjacent(roadGraph, roadGraphNode1, roadGraphNode2)
 [1] FALSE
```

Function #3: articulation points

> articulation_points(roadGraph)

+ 296/13941 vertices, named, from be27da5: [1] 5771 8123 6030 6001 6442 6488 6487 6385 6478 6460 6384 6995 8189 8197 [15] 13456 13434 25078 30009 66649 83915 115326 107733 109792 109791 135335 116085 116651 111826 [29] 114741 115586 118527 122744 123093 125702 1181851 177505 186217 226500 218986 225120 225118 225022 [43] 225073 225197 226634 226631 293178 294541 294544 294545 293763 292365 293754 294195 295866 [57] 364035 408484 436142 453260 504171 504175 504185 498390 534751 573435 500859 504777 534232 [71] 505902 505897 534840 534844 534874 507518 508141 509123 512565 512773 534950 554587 542737 542632 [85] 542517 542516 544200 545463 548067 548349 548866 551537 551966 629367 658786 658747 556874 [99] 560917 561026 561018 561365 562527 562909 563946 564691 565440 566181 574367 617407 580482 659694 [113] 585336 583951 584802 585415 585571 586685 586684 586683 587947 587958 587959 587851 589179 [127] 601015 602340 602854 603508 603897 617103 617104 632082 667717 641959 643655 643677 643135 667816 + ... omitted several vertices

Function #7: vertex connectivity

> vertex_connectivity(roadGraph)
[1] 0

For functions 8 - 15, the following reduction was made to the graph in order to make these computationally expensive functions able to complete in a reasonable amount of time:

```
> roadGraphDegree <- degree(roadGraph)
> roadGraph <- delete_vertices(roadGraph, which(roadGraphDegree <= 8))</pre>
```

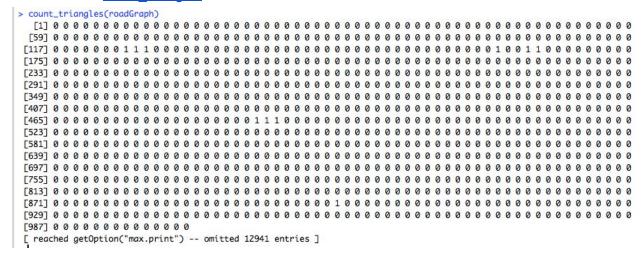

Function #8: farthest vertices

```
> farthest_vertices(roadGraph)
$vertices
+ 2/13941 vertices, named, from 24fe843:
[1] 6480 6484
$distance
[1] 6
```
